

# Global and Local Image Warping Jun-Yan Zhu

16-726 Learning-based Image Synthesis, Spring 2022

# Logistics

#### 1. Homework 0 released

Deadline: 02/01/2022

#### How to submit assignments? (in general)

For each assignment, you will be required to submit two packages unless specified otherwise: your code and your webpage:

Submit code to Canvas

For every assignment you should create a main.py that can be used to run all your code for the assignment, and a README.md file that contains all required documentation. Place all source code used to generate your results, as well as any documentation required to use the code, in a folder named andrewid\_code\_projx where X is the hw number. Zip the whole folder and submit the zip to Canvas. Here is an example of your folder structure:

```
zhiqiul_code_proj1/
    main.py
    README.md
    utils.py
    ....
## zip the whold folder to zhiqiul_code_proj1.zip:
```

Submit your webpage to the class website

We will use Andrew File System(AFS) to store and display webpages. Here is a step by step tutorial:

- 1. Place your website under folder projx and zip it. Please make sure that your main report page is called index.html so browsers open it automatically. X is the hw number.
- 2. Remote Copy. Use WinSCP or your favorite scp/ftp tool to copy all your files to your Andrew home directory scp projx.zip andrew\_id@linux.andrew.cmu.edu:/home/andrew\_id/.
- 3. Log in to a Unix Andrew machine: ssh andrew\_id@linux.andrew.cmu.edu
- 4. File Transfer. Unzip your website and copy the folder to your project directory: cp -r projx/

# Logistics

2. Hybrid mode (in-person + remote + rotation)

Group A: Monday

Group B: Wednesday

3. Optional reading list: read after each class

4. Student Presentation sign-up sheet.

**Data-driven Graphics** 

**Generative Models** 

Conditional Image Synthesis

Image Editing with Optimization

**Face Modeling** 

3D and Video Synthesis

## Student Presentation

### Data-Driven Graphics (2000-2010)

- Graphcut Texture, SIGGRAPH 2003.
- Interactive Digital Photomontage, SIGGRAPH 2004.
- GrabCut, SIGGRAPH 2004.
- Hybrid Images, SIGGRAPH 2006.
- Photo Clip Art, SIGGARPH 2007.
- Image Deformation Using Moving Least Squares. SIGGRAPH 2006.
- Seam Carving for Content-Aware Image Resizing, SIGGRAPH 2007.
- Sketch2Photo, SIGGRAPH Asia 2009.
- Coordinates for Instant Image Cloning, SIGGRAPH 2009
- ...

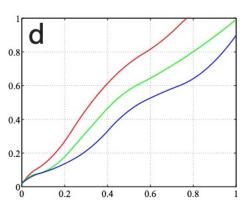

# Review: how to create an image

- Pointwise Processing:

**Image Filtering** 

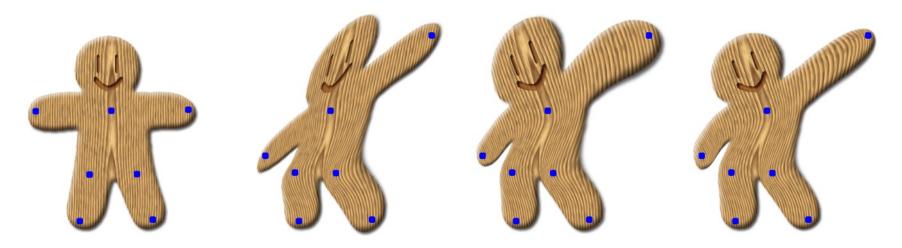

$$\sigma$$
 = 30 pixels

# Global and Local Image Warping Jun-Yan Zhu

16-726 Learning-based Image Synthesis, Spring 2022

# Image Transformations

image filtering: change range of image

$$g(x) = T(f(x))$$

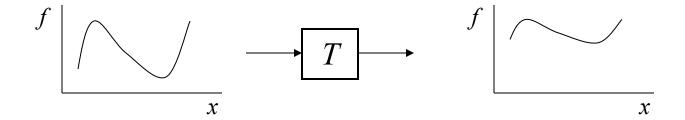

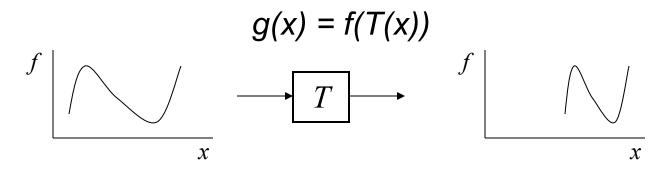

image warping: change domain of image

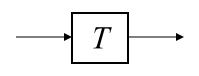

# **Image Transformations**

### image filtering: change range of image

$$g(x) = T(f(x))$$

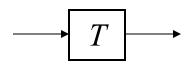

## image warping: change domain of image

$$g(x) = f(T(x))$$

# Parametric (global) warping

## Examples of parametric warps:

translation

affine

Totation

perspective

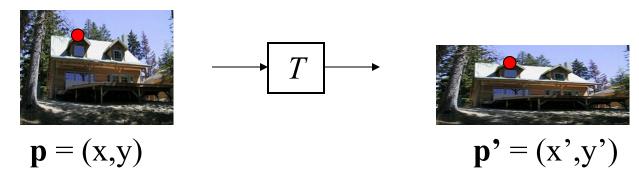

aspect

cylindrical

# Parametric (global) warping

Transformation T is a coordinate-changing machine:

$$p' = T(p)$$

What does it mean that *T* is global?

- Is the same for any point p
- can be described by just a few numbers (parameters)

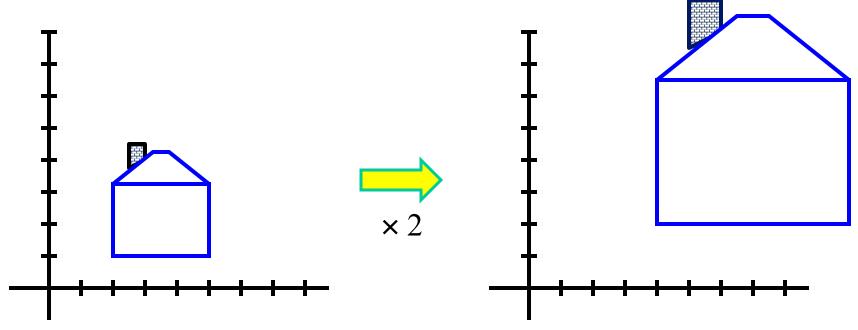

Let's represent a <u>linear</u> *T* as a matrix:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \mathbf{M} \begin{bmatrix} x \\ y \end{bmatrix}$$

# Scaling

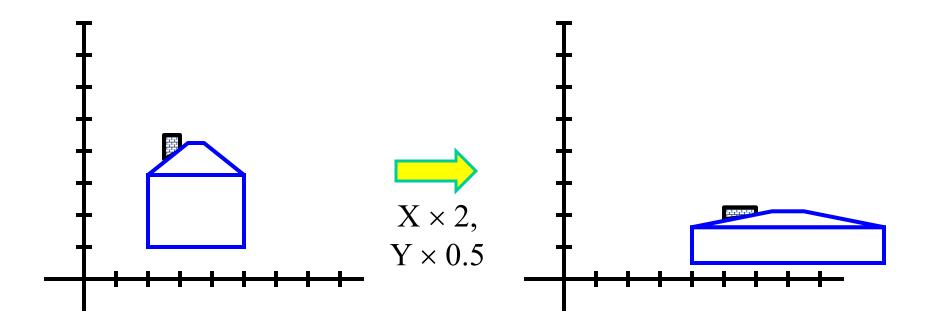

Scaling a coordinate means multiplying each of its components by a scalar

*Uniform scaling* means this scalar is the same for all components:

# Scaling

Non-uniform scaling: different scalars per component:

# Scaling

Scaling operation:

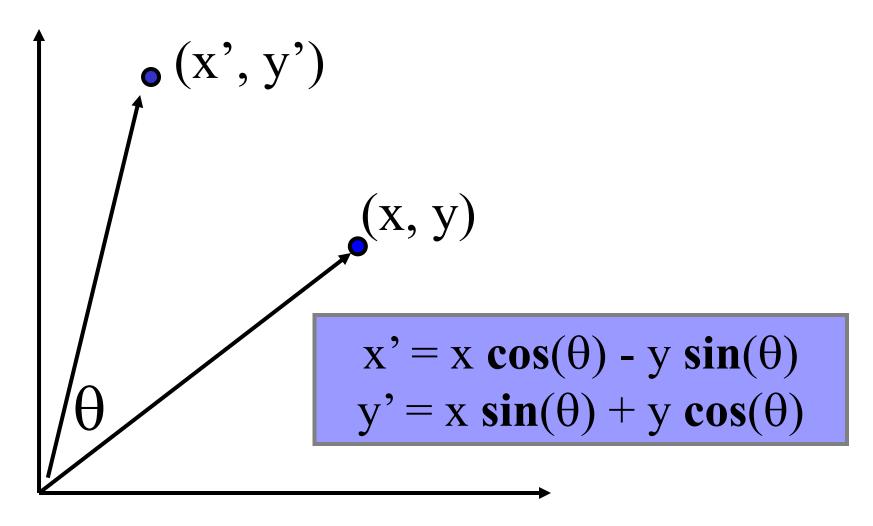

$$x' = ax$$

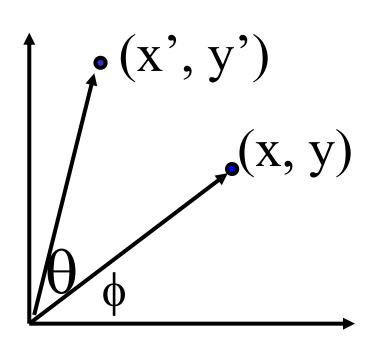

$$y' = by$$

Or, in matrix form:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$
scaling matrix S

What's inverse of S?

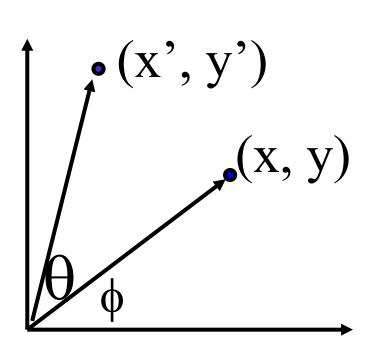

$$x = r \cos (\phi)$$

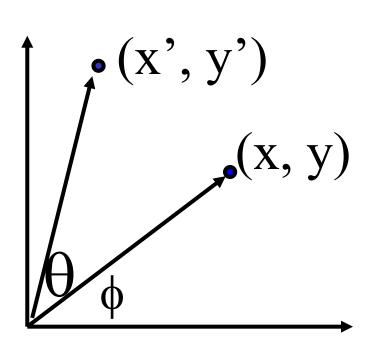

$$y = r \sin (\phi)$$

$$x' = r \cos (\phi + \theta)$$

$$y' = r \sin (\phi + \theta)$$

```
x = r \cos (\phi)
y = r \sin (\phi)
x' = r \cos (\phi + \theta)
y' = r \sin (\phi + \theta)
Trig Identity...
x' = r \cos(\phi) \cos(\theta) - r \sin(\phi) \sin(\theta)
y' = r \sin(\phi) \cos(\theta) + r \cos(\phi) \sin(\theta)
```

```
x = r \cos (\phi)
y = r \sin (\phi)
x' = r \cos (\phi + \theta)
y' = r \sin (\phi + \theta)
Trig Identity...
x' = r \cos(\phi) \cos(\theta) - r \sin(\phi) \sin(\theta)
y' = r \sin(\phi) \cos(\theta) + r \cos(\phi) \sin(\theta)
```

### Substitute...

$$x' = x \cos(\theta) - y \sin(\theta)$$
  
 $y' = x \sin(\theta) + y \cos(\theta)$ 

This is easy to capture in matrix form:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$
R

Even though  $sin(\theta)$  and  $cos(\theta)$  are nonlinear functions of  $\theta$ ,

- x' is a linear combination of x and y
- y' is a linear combination of x and y

What is the inverse transformation?

- Rotation by  $-\theta$
- For rotation matrices  $\mathbf{R}^{-1} = \mathbf{R}^T$

What types of transformations can be represented with a 2x2 matrix?

# 2D Identity?

$$x' = x$$
$$y' = y$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

# 2D Scale around (0,0)?

$$x' = s_x * x$$
 $y' = s_y * y$ 

$$y' = s_y * y$$

$$\begin{bmatrix} \mathbf{x}' \\ \mathbf{y}' \end{bmatrix} = \begin{bmatrix} \mathbf{s}_x & 0 \\ 0 & \mathbf{s}_y \end{bmatrix} \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \end{bmatrix}$$

What types of transformations can be represented with a 2x2 matrix?

## 2D Rotate around (0,0)?

$$x' = \cos \Theta * x - \sin \Theta * y$$
$$y' = \sin \Theta * x + \cos \Theta * y$$

$$x' = \cos \Theta * x - \sin \Theta * y y' = \sin \Theta * x + \cos \Theta * y$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \Theta & -\sin \Theta \\ \sin \Theta & \cos \Theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

#### 2D Shear?

$$x' = x + sh_x * y$$
$$y' = sh_y * x + y$$

$$\begin{bmatrix} \mathbf{x'} \\ \mathbf{y'} \end{bmatrix} = \begin{bmatrix} 1 & \mathbf{s} \mathbf{h}_x \\ \mathbf{s} \mathbf{h}_y & 1 \end{bmatrix} \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \end{bmatrix}$$

What types of transformations can be represented with a 2x2 matrix?

### 2D Mirror about Y axis?

$$x' = -x$$
$$y' = y$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

## 2D Mirror over (0,0)?

$$x' = -x$$
$$y' = -y$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

What types of transformations can be represented with a 2x2 matrix?

#### 2D Translation?

$$x' = x + t_x$$
 $y' = y + t_y$ 
NO!

Only linear 2D transformations can be represented with a 2x2 matrix

## All 2D Linear Transformations

#### Linear transformations are combinations of ...

- Scale,
- Rotation,
- · Shear, and
- Mirror

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

#### Properties of linear transformations:

- Origin maps to origin
- · Lines map to lines
- Parallel lines remain parallel
- · Ratios are preserved
- Closed under composition

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} e & f \\ g & h \end{bmatrix} \begin{bmatrix} i & j \\ k & l \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

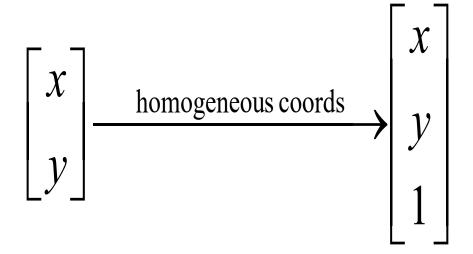

# Q: How can we represent translation as a 3x3 matrix?

$$x' = x + t_x$$

$$y' = y + t_y$$

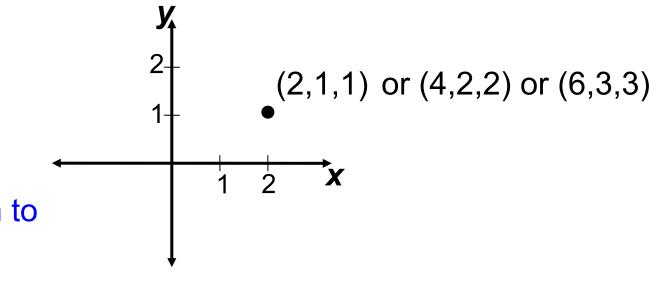

## Homogeneous coordinates

 represent coordinates in 2 dimensions with a 3-vector

## Add a 3rd coordinate to every 2D point

- (x, y, w) represents a point at location (x/w, y/w)
- (x, y, 0) represents a point at infinity
- (0, 0, 0) is not allowed

Convenient coordinate system to represent many useful transformations

# Q: How can we represent translation as a 3x3 matrix?

$$x' = x + t_x$$
$$y' = y + t_y$$

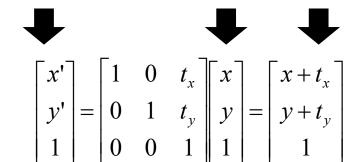

A: Using the rightmost column:

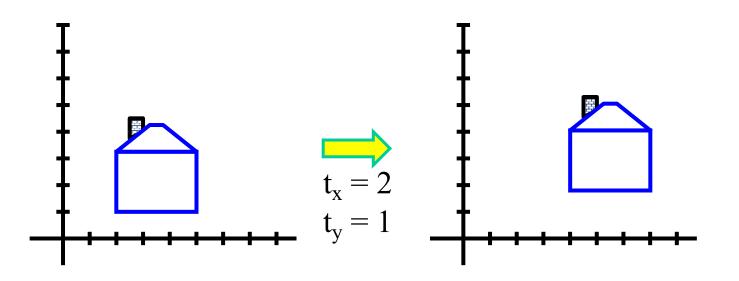

$$\mathbf{Translation} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix}$$

## **Translation**

#### Example of translation

## Homogeneous Coordinates

## **Basic 2D Transformations**

#### Basic 2D transformations as 3x3 matrices

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

**Translate** 

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} \cos \Theta & -\sin \Theta & 0 \\ \sin \Theta & \cos \Theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & sh_x & 0 \\ sh_y & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Rotate

$$\begin{bmatrix} \mathbf{x'} \\ \mathbf{y'} \\ 1 \end{bmatrix} = \begin{bmatrix} \mathbf{s}_x & 0 & 0 \\ 0 & \mathbf{s}_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ 1 \end{bmatrix}$$

Scale

$$\begin{bmatrix} \mathbf{x'} \\ \mathbf{y'} \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & s\mathbf{h}_x & 0 \\ s\mathbf{h}_y & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ 1 \end{bmatrix}$$

Shear

# **Matrix Composition**

Transformations can be combined by matrix multiplication

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & 0 & tx \\ 0 & 1 & ty \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos \Theta & -\sin \Theta & 0 \\ \sin \Theta & \cos \Theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} sx & 0 & 0 \\ 0 & sy & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

$$\mathbf{p}' = \mathbf{T}(\mathbf{t}_{\mathsf{x}}, \mathbf{t}_{\mathsf{y}}) \qquad \mathbf{R}(\Theta) \qquad \mathbf{S}(\mathbf{s}_{\mathsf{x}}, \mathbf{s}_{\mathsf{y}}) \qquad \mathbf{p}$$

Does the order of multiplication matter?

## Affine Transformations

- Affine transformations are combinations of ...  $\begin{vmatrix} x' \\ y' \\ w \end{vmatrix} = \begin{vmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{vmatrix} \begin{vmatrix} x \\ y \\ w \end{vmatrix}$ 

  - **Translations**

Properties of affine transformations:

- Origin does not necessarily map to origin
- Lines map to lines
- Parallel lines remain parallel
- Ratios are preserved
- Closed under composition
- Models change of basis

Will the last coordinate w always be 1?

# **Projective Transformations**

#### Projective transformations ...

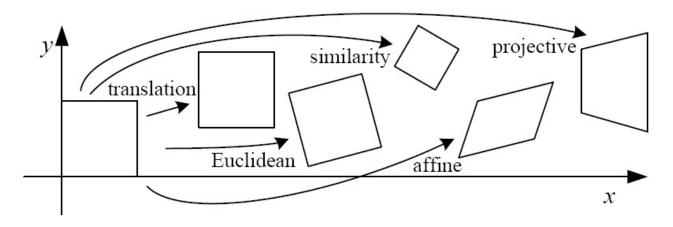

- Affine transformations, and
- Projective warps

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

#### Properties of projective transformations:

- Origin does not necessarily map to origin
- Lines map to lines
- Parallel lines do not necessarily remain parallel
- Ratios are not preserved
- Closed under composition
- Models change of basis

# 2D image transformations

# Recovering Transformations

# What if we know *f* and *g* and want to recover the transform T?

- e.g. better align images from Project 1
- willing to let user provide correspondences
  - How many do we need?

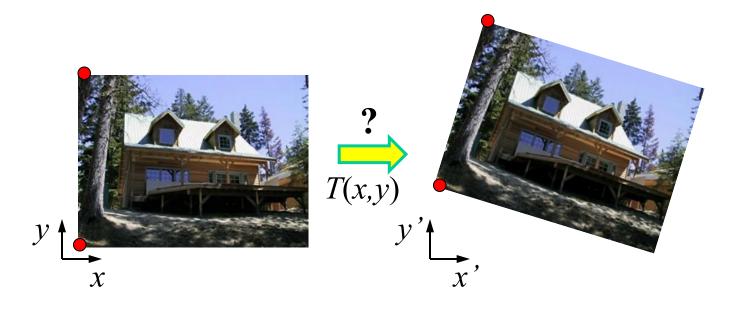

# Translation: # correspondences?

How many correspondences needed for translation?
How many Degrees of Freedom?
What is the transformation matrix?

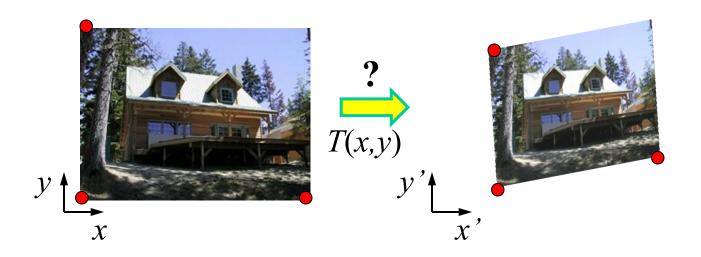

$$\mathbf{M} = \begin{bmatrix} 1 & 0 & p'_x - p_x \\ 0 & 1 & p'_y - p_y \\ 0 & 0 & 1 \end{bmatrix}$$

### Euclidian: # correspondences?

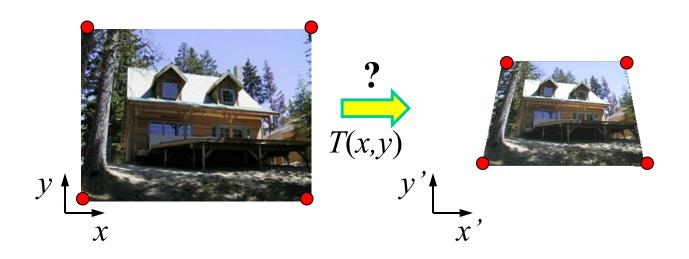

How many correspondences needed for translation+rotation? How many DOF?

### Affine: # correspondences?

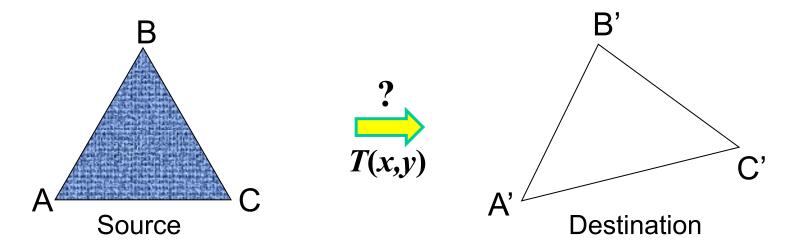

How many correspondences needed for affine? How many DOF?

### Projective: # correspondences?

How many correspondences needed for projective? How many DOF?

### Example: warping triangles

Given two triangles: ABC and A'B'C' in 2D (12 numbers)

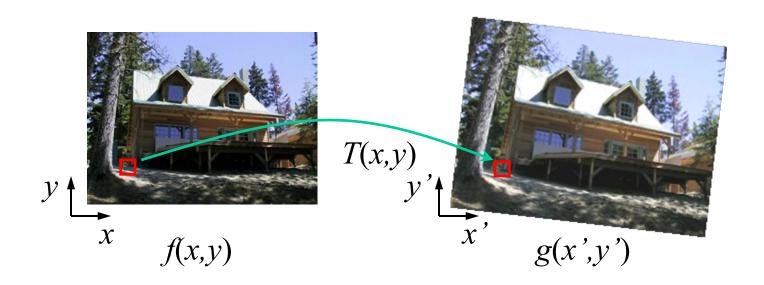

Need to find transform T to transfer all pixels from one to the other.

What kind of transformation is T?

How can we compute the transformation matrix:

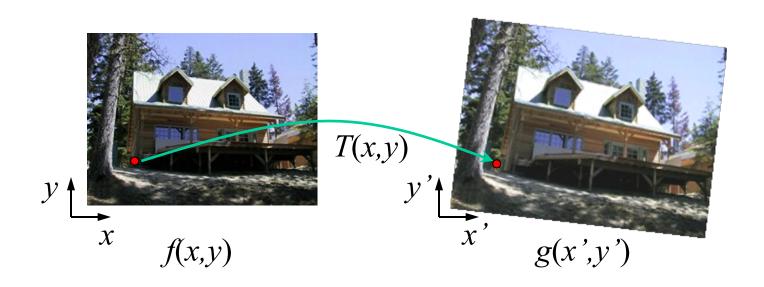

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

### Image warping

Given a coordinate transform (x',y') = T(x,y) and a source image f(x,y), how do we compute a transformed image g(x',y') = f(T(x,y))?

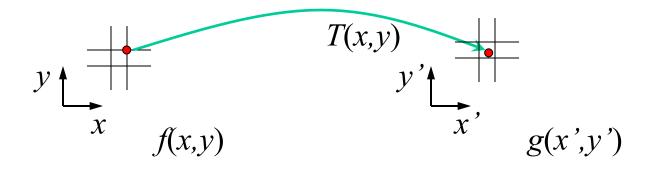

### Forward warping

Send each pixel f(x,y) to its corresponding location (x',y') = T(x,y) in the second image

Q: what if pixel lands "between" two pixels?

### Forward warping

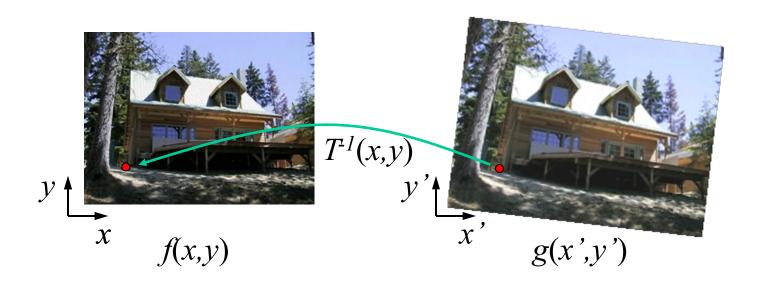

Send each pixel f(x,y) to its corresponding location (x',y') = T(x,y) in the second image

Q: what if pixel lands "between" two pixels?

A: distribute color among neighboring pixels (x',y')

- Known as "splatting"
- Check out griddata in Matlab

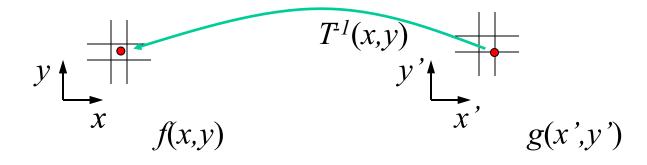

### Inverse warping

Get each pixel g(x',y') from its corresponding location  $(x,y) = T^{-1}(x',y')$  in the first image

Q: what if pixel comes from "between" two pixels?

### Inverse warping

Get each pixel g(x',y') from its corresponding location  $(x,y) = T^{-1}(x',y')$  in the first image

Q: what if pixel comes from "between" two pixels?

A: Interpolate color value from neighbors

- nearest neighbor, bilinear, Gaussian, bicubic
- Check out interp2 in Matlab

### Forward vs. inverse warping

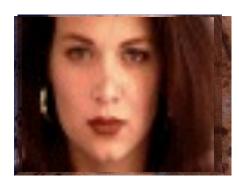

Q: which is better?

#### A: usually inverse—eliminates holes

however, it requires an invertible warp function—not always possible...

### Morphing = Object Averaging

#### The aim is to find "an average" between two objects

- Not an average of two <u>images of objects</u>…
- ...but an image of the <u>average object!</u>
- How can we make a smooth transition in time?
  - Do a "weighted average" over time t

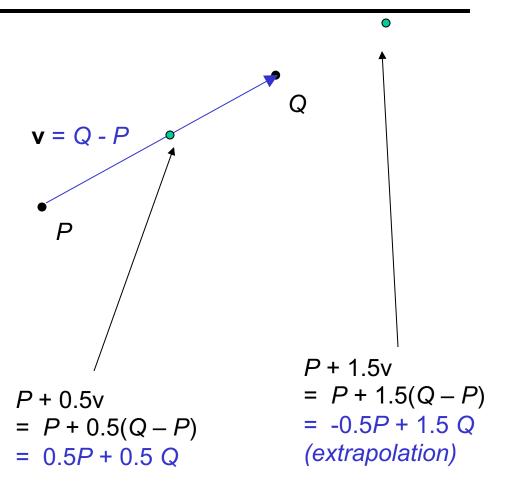

#### How do we know what the average object looks like?

- We haven't a clue!
- But we can often fake something reasonable
  - Usually required user/artist input

### **Averaging Points**

What's the average of P and Q?

Linear Interpolation (Affine Combination): New point aP + bQ, defined only when a+b = 1So aP+bQ = aP+(1-a)Q

#### P and Q can be anything:

points on a plane (2D) or in space (3D)

52

- Colors in RGB or HSV (3D)
- Whole images (m-by-n D)... etc.

#### Idea #1: Cross-Dissolve

Interpolate whole images:

 $Image_{halfway} = (1-t)*Image_1 + t*image_2$ 

This is called **cross-dissolve** in film industry

But what is the images are not aligned?

### Idea #2: Align, then cross-disolve

#### Align first, then cross-dissolve

Alignment using global warp – picture still valid

### Global warp not always enough!

#### What to do?

- Cross-dissolve doesn't work
- Global alignment doesn't work
  - Cannot be done with a global transformation (e.g. affine)
- Any ideas?

#### Feature matching!

- Nose to nose, tail to tail, etc.
- This is a local (non-parametric) warp

### Local (non-parametric) Image Warping

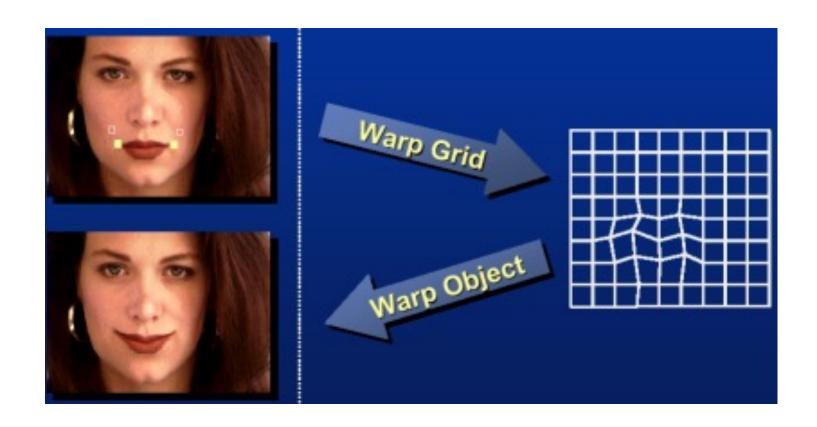

#### Need to specify a more detailed warp function

- Global warps were functions of a few (2,4,8) parameters
- Non-parametric warps u(x,y) and v(x,y) can be defined independently for every single location x,y!
- Once we know vector field u,v we can easily warp each pixel (use backward warping with interpolation)

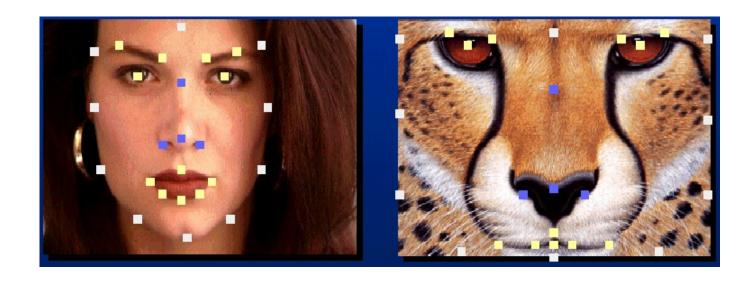

### Warp specification -- dense

Define vector field to specify a dense warp

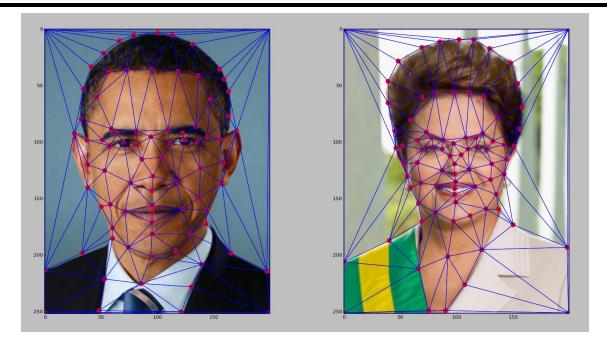

### Warp specification - sparse

How can we specify a sparse warp?

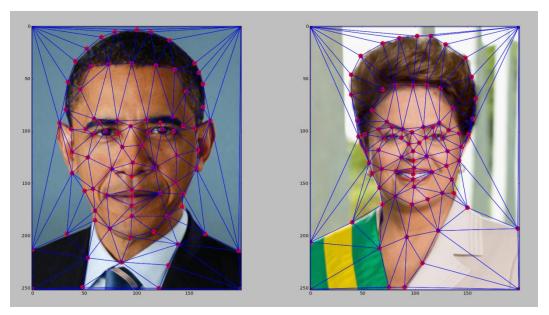

How do we go from feature points to pixels?

### Triangular Mesh

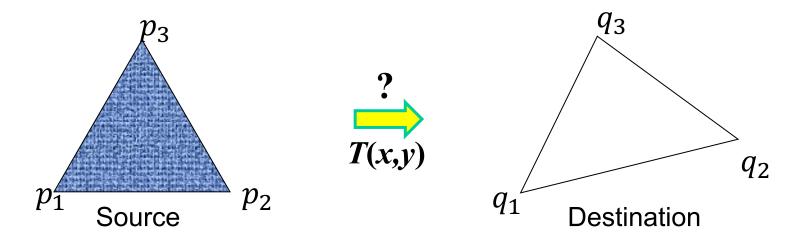

- 1. Input correspondences at key feature points
- 2. Define a triangular mesh over the points
  - Same mesh in both images!
  - Now we have triangle-to-triangle correspondences
- 3. Warp each triangle separately from source to destination
  - How do we warp a triangle?

(c) Ian Albuquerque Raymundo da Silva

### Warping triangles

Given two triangles:  $p_1p_2p_3$  and  $q_1q_2q_3$  in 2D (12 numbers) Need to find transform T to transfer all pixels from one to the other.

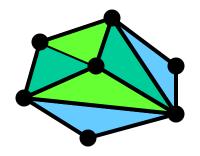

What kind of transformation is T?

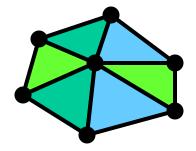

How can we compute the transformation matrix:

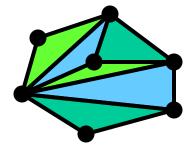

### Triangulations

A *triangulation* of set of points in the plane is a *partition* of the convex hull to triangles whose vertices are the points, and do not contain other points.

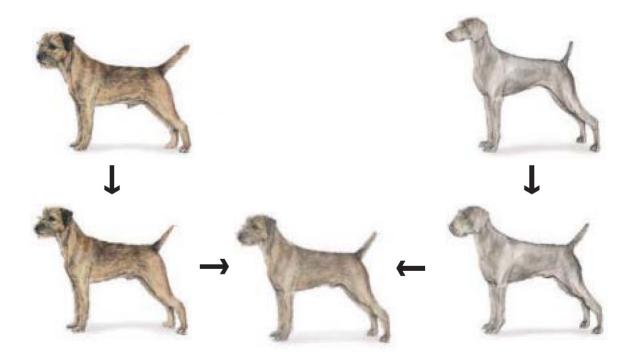

There are an exponential number of triangulations of a point set.

### Full Morphing Procedure

Morphing procedure:

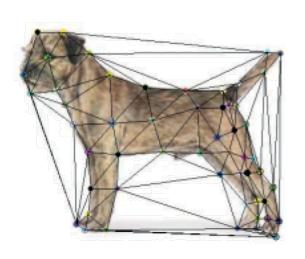

#### for every t,

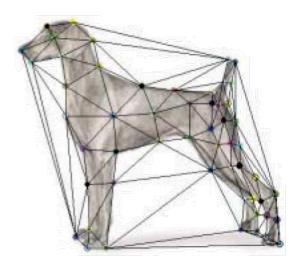

- 1. Find the average shape (the "mean dog" ©)
  - local warping
- 2. Find the average color
  - Cross-dissolve the warped images

### 1. Create Average Shape

How do we create an intermediate warp at time t?

- Assume t = [0,1]
- Simple linear interpolation of each feature pair
  - $p \rightarrow q$
  - $(1-t) \cdot p + t \cdot q$  for corresponding features p and p'

### 2. Create Average Color

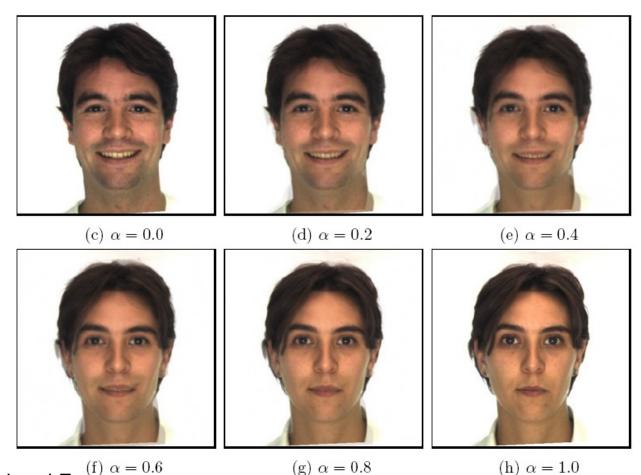

Interpolate whole images:

 $Image_{halfway} = (1-t)*Image + t*image'$ 

cross-dissolve!

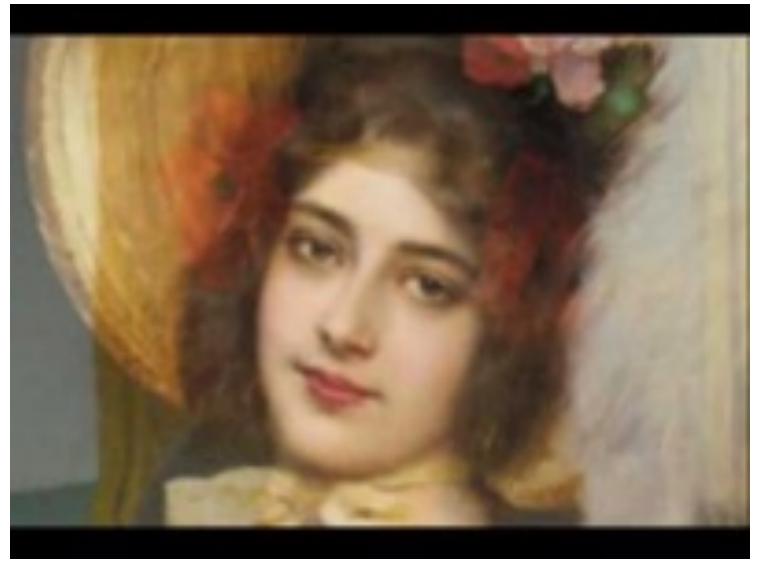

### Morphing & matting

# Extract foreground first to avoid artifacts in the background

66

### Amuse-bouche

By Philip Scott Johnson

67

### Moving Least Square

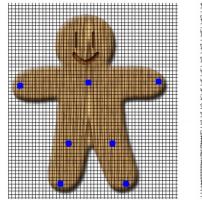

What is a good local warping function  $T(p) \rightarrow q$ ?

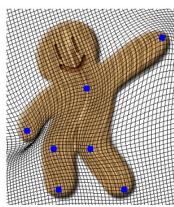

- Interpolation: need to satisfy control points  $T(p_i) = q_i$
- Smoothness: T should be smooth;
- Identity: if  $p_i = q_i$ , T should be an identity mapping Triangulation-based methods:

 $argmin_T ||T(p_i) - q_i||^2$  for 3 vertices in each triangle **Moving least squares:** 

 $argmin_T w_i ||T(p_i) - q_i||^2$  for all the control points

Where 
$$w_i = \frac{1}{|p_i - v|^{2\alpha}}$$

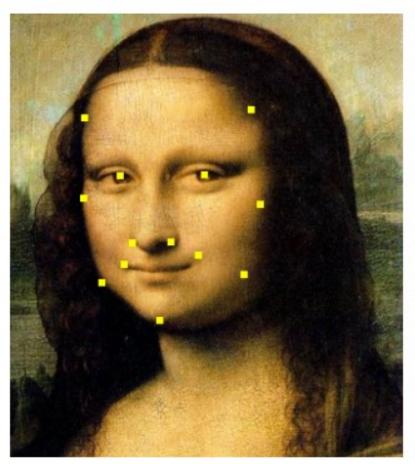

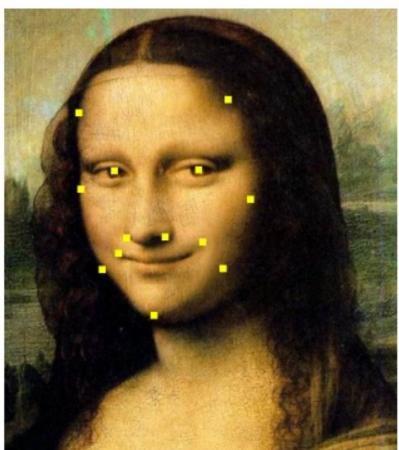

# Moving Least Square

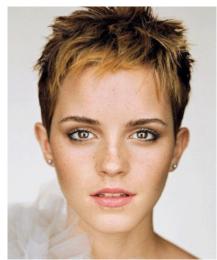

## Moving Least Square

# Thank You!
